#### **DETAILED ACTION**

# Claim Rejections - 35 USC § 102

1. Rejections withdrawn.

### Allowable Subject Matter

2. Claims 44, 46-57 are allowed. The following is an examiner's statement of reasons for allowance:

Referring to claims 44, 46-51, 54, 57, Jang, fails to teach and it would not be obvious to a person of ordinary skill in the art to combine with Jang, a method for producing a three-dimensional multi-material component by the ink-jet-type printing of droplets of at least one material in successive layers having all the claimed features of applicant's instant invention, specifically including:

"wherein the slicing of the representation of the multi-material composite consists in maximising the quantity of materials deposited per print layer".

"determining a first modulation of discrete spatial print path trajectories for each print layer; determining at least one predetermined direction of discrete spatial print path trajectory for each print layer; determining a second modulation of the discrete spatial print path trajectory from a current layer to the following layer for two successive print layers of the same object, said second modulation depending on the number of constituent layers to be deposited for said object in order to optimise the cohesion of the final structure of said multi-material component".

"wherein the spatial and temporal sequencing law for print path of the print layers and the discrete spatial trajectories comprises a plurality of printing instructions and of successive cleanings of the ejection system".

"wherein one of the printing parameters is the ejection distance orthogonal to the deposition surface, said method consisting in regulating said ejection distance around nominal values, the nominal values being determined so as to optimise the deposition of the materials on the deposition surface".

"wherein one of the printing parameters is the degree of obstruction of the ejection system, said method consisting in cleaning the ejection system once the degree of obstruction exceeds a predetermined obstruction threshold value".

"wherein one of the printing parameters is the power and wavelength of a radiation applied to the deposited materials as a function of the nature of the deposited materials".
